

The discovered belief compound passes the false-belief test

On a held-out Sally-Anne scene, the learned fork(derive, commit) abstraction sends the agent to where it believes the goal is; the shortest program in the non-mental fragment sends it to the true goal — the answer three-year-olds give. (24/24 held-out scenes, both.)

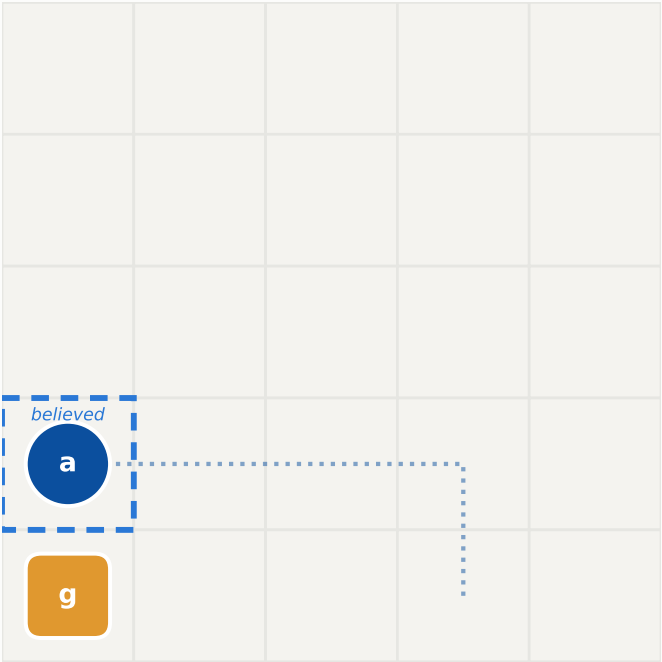

A held-out scene

agent a, true goal g; the goal is "believed" one cell away

Belief compound ✓

learner with the discovered fork, as decomposed plumbing

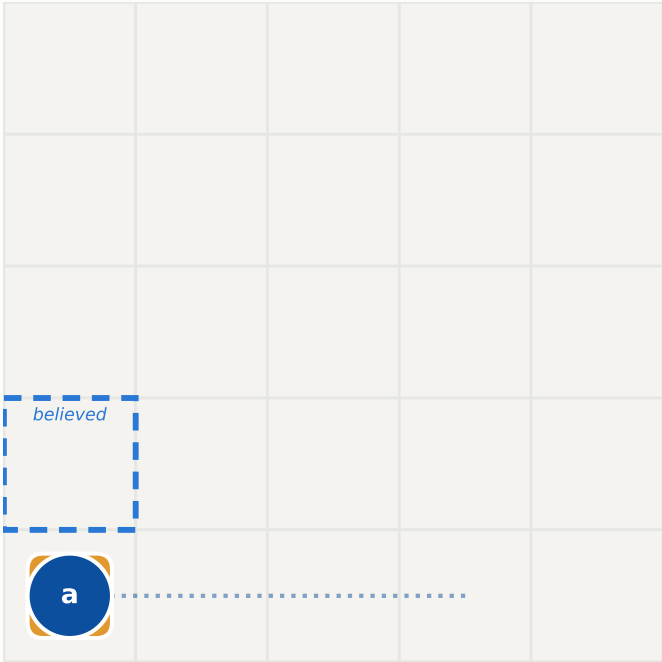

searches the BELIEVED cell — passes

(fn_0 1 2 (step 2 up) (fn_5 1))
17.8 nats

Non-mental fragment ✗

learner restricted to physics only

searches the TRUE cell — the naive answer

(optimize (neg_dist 2) 1)
7.8 nats · shortest non-mental
