

Belief is reached late and cheaply — an S-curve of solves, and a solve-time collapse the round its abstraction lands

Non-mental families solve in round 1 and sit flat at their ceiling. Belief becomes reachable only once the joint stitch abstracts the parts it reuses — its enumeration time then drops from the full timeout to seconds in a single round, the round its S-curve steps up.

Phase 1 — atomic fork/sync (cumulative solves)

per-task solve-time collapse

no per-task timings in this run
(re-run the phase, or pass --log <run stdout>)
